Bureau of Agricultural Economics
Washington

WS-12 October 23, 1937.

THE WHEAT SITUATION

Summary

Wheat prices during the next few months, the Bureau of Agricultural Economics states, will depend largely on changes in crop prospects in Argentina and Australia, Soviet Russia's policy regarding exports, the tenseness of the political situation in Europe, reports on the area sown and progress of next year's crops in the Northern Hemisphere, and domestic business conditions. For several weeks the decline in stock prices has depressed wheat prices, and general business sentiment will continue to affect wheat prices.

The combined crops in Argentina and Australia are still estimated to be about 40 million bushels smaller than last year. Rainfall has continued inadequate for the crop in large areas of these two countries.

While some western areas of the United States remain dry, moisture conditions for winter wheat are generally better than a year ago.

Exports from the United States during the current season to date have been small amounting to only about 17 million bushels during the July-October 15 period. This has been the result of a number of factors, one of the most important of which has been the extreme shortage of ocean shipping space, which has resulted in the highest ocean freight rates in recent years. The widening of the spread of United States prices under those in importing countries, however, has recently become great enough to offset the higher rates and exports have increased. Cheaper offerings from other countries and the uncertainty regarding the quantity of Russian shipments also have been significant factors in reducing the foreign demand for United States wheat.

Soviet wheat exports remain largely a matter of conjecture, the prices being dependent upon government policy. The apparently good 1937 crop and the high level of prices favor fairly substantial Soviet exports this year. If a more tense political situation should develop in Europe, the various countries would undoubtedly make an effort to increase wheat stocks.

Prospective world wheat supplies for the current year (beginning July 1), excluding those of Soviet Russia and China, are still estimated to be about 60 million bushels larger than the small supplies of 1936-37. The reduction in carryover stocks of 210 million bushels compared with last year, are more than offset by a 270 million-bushel increase in the estimated world crop. On the basis of these present estimates and allowing about 30 million bushels from Soviet Russia, if disappearance in 1937-38 is about the same as the average for the past 3 years, world stocks next summer will be less than 600 million bushels. World stocks this year are estimated at about 520 million bushels,compared with 650 million bushels in the 1924-28 period, before large stocks accumulated.

THE WORLD WHEAT SITUATION

BACKGROUND.- Total world supplies of wheat, after increasing from 1929 to 1933, declined sharply as a result of successive years of small production and increased world demand. Apparent world disappearance has averaged about 3,770 million bushels during the past 10 years. World market prices of wheat have moved steadily upward since the spring of 1933, reflecting higher world commodity price levels, four successive below average harvests in North America, and the 1935-36 short Southern Hemisphere crop. World prices during 1936-37 advanced sharply as a result of increased demand and the smallest supplies in recent years.

World wheat production above last year

The 1937-38 wheat crop of the world, excluding Soviet Russia and China, is now estimated at 3,809 million bushels, which is 7 percent above the estimated world harvest last year, and is 6 percent above the 1935-36 harvest. The current crop in the United States is placed at 887 million bushels, or 1 million bushels

larger than September indications. The Canadian crop estimate will not be revised until November. The 30 European countries reporting indicate a yield of 1,530 million bushels in Europe. This is a gain of 3 percent over the small European crop of last year, but is 3 percent less than the 1935 production. The decrease of 7 million bushels from the September total is accounted for by the downward revision of 12 million bushels in the estimated yield in Spain and the 3 million-bushel decrease in the estimate for England and Wales. These decreases were only partly compensated for by upward revisions in the estimates for Greece and Austria. The crop in the Danubian countries, reported at 357 million bushels, is 7 percent below the large 1936 crop. The total of other European countries, however, shows a gain of 7 percent over last year's crop.

The Bureau's September estimate of production in Argentina and Australia remains unchanged. During the latter part of September and the first of October, rainfall improved conditions in some drought areas in the Argentine. In most sections, however, the precipitation has been inadequate for the needs of the crop. In Australia the drought has continued with only slight relief from scattered showers. Good rains are urgently needed over large areas.

The 1937 wheat crop in China is now estimated at 640 million bushels, which is 151 million bushels below the 1936 production and is 140 million bushels less than the average production for the 5 years, 1931-35. The relatively low 1937 yield was caused by unfavorable weather conditions, particularly in North China. The quality of the new crop is reported to be higher than that of the 1936 harvest.

World wheat trade

Table 2 shows what seems to be a reasonable expectancy of the quantities of wheat which may be furnished by the various shippers for the year beginning July 1, 1937, assuming net exports of about 485 million bushels 1/, together with net exports for the 2 years preceding. The estimates for 1937 are based on present estimates of carry-over stocks and crops. As estimates are revised or demand prospects change, the probable export figures will need to be adjusted accordingly.

Table 2 also shows approximate shipments during July through October 15 for the past 3 years. While shipments during this period this year have been smaller than in 1936, they are only about 14 million bushels less than in 1935. The estimate for the 1937-38 total movement is about 24 million bushels less than the 1935-36 total.

In 1935-36 and 1936-37 the United States was a net importer and Canada was a heavy shipper. This year, with a small carry-over and a very small crop, Canada is not expected to export more than about 65 million bushels. Figures showing the actual movement of wheat reported to date appear in tables 7-10.

Exports from the United States during the current season to date have been small, amounting to only about 17 million bushels for the period July 1 - October 15. This has been the result of a number of factors, one of the most

---

Foreign wheat prices

Liverpool wheat prices turned upward from about August 23 to late September, largely as the result of higher prices asked on new shipments of Australian and Indian wheat and also on January-February shipments from Argentina. During the first week in October, Liverpool prices declined sharply as shipments from Soviet Russia became heavy. On October 9, however, Soviet Russia raised its quotations 3 cents, thereby possibly suggesting that it did not intend to force very large exports this year. At the same time, the downward trend in prices appeared to have been checked.

The December future at Liverpool averaged 5½ cents higher for the week ended October 9 than for the week ended August 28, while Winnipeg averaged only 2½ cents higher; thus the spread between these two markets widened. The advance in the November future at Buenos Aires was 22 cents during the same period, largely as a result of a tight supply situation as the November delivery month approaches. This latter advance, however, has subsequently been greatly reduced.

THE DOMESTIC WHEAT SITUATION

BACKGROUND.- The carry-over of wheat in the United States for the 5-year period (1924-28) averaged about 115 million bushels. Stocks which began to accumulate in 1929 reached the record peak of 378 million bushels in 1933. Four small wheat crops since that time, however, reduced stocks to 103 million bushels by July 1, 1937.

Domestic wheat prices from the spring of 1933-34 to that of 1936-37 were unusually high relative to world market prices, as a result of four small domestic crops caused largely by abnormally low yields per acre. During 1936-37 both world and domestic prices advanced sharply as a result of increased demand and the smallest supplies in recent years.

Domestic wheat supplies

A total wheat crop of 886,895,000 bushels in the United States was indicated by the October 1 crop report. This is about one million bushels more than the 885,950,000 bushels reported September 1. The increase is entirely in the estimate for spring wheat production (durum production was increased 1,038,000 bushels), as the winter wheat estimate remains unchanged from August until it is revised in December.

About 23,500,000 acres were seeded to spring wheat this year, this acreage has been exceeded only three times in the history of the United States (the winter wheat acreage seeded was the largest in history as was also the combined seeding of winter and spring.)

Yields per seeded acre of spring wheat averaged 8.5 bushels compared with 11.9 bushels, the average of the 10-year (1923-32) period. Yields per acre of spring wheat were generally below the 10-year average except in the area west of the Rocky Mountains. With the exception of the Pacific Northwest, Minnesota was the only important spring wheat producing State reporting an above average yield this year. In the remainder of the principal spring wheat producing region, the crop suffered severe injury from drought and black stem rust.

Supplies of Hard Red Spring and durum wheats are about ample to take care of prospective requirements 2/, while supplies of hard and soft red winter and white wheats are considerably in excess of domestic requirements. On the basis of exports of about 95 million bushels 2/, which would be mostly of hard red winter wheat, carry-over stocks on July 1, 1938, would be expected to amount to about 200 million bushels. While stocks of this size would be larger than those of the past 3 years, they would fall far short of the 1930-34 average of 326 million bushels.

Domestic wheat prices

Wheat prices in domestic markets remained at about the same level during the period from late August to late September, when Liverpool prices were rising. This widened the spread of domestic prices under those of Liverpool. No. 2 Hard Winter at Kansas City (table 4) averaged 1/2 cent lower and No. 1 Dark Northern Spring at Minneapolis averaged 1½ cents lower for the week ended October 9 than for the week ended August 28. The price of No. 2 Red at St.Louis averaged one-half cent higher during the same period. The spread of the Chicago December future under the Liverpool December (table 5) widened to 27 cents, and the spread of the Kansas City and Liverpool December future to 31 cents, the widest this season. As a result, exports from the United States increased.

1/ A table showing estimated prospective wheat supplies and distribution by classes for 1937-38 was published in The Wheat Situation for September, page 18.
